

Sink OS V2 script

[Introduce Sink OS, talk about the past, and introduce]

Good morning/afternoon/evening, everyone. I'm Rav, and it is an honour to be here to present my Enrichment project.

So last year, we launched a browser-based operating system named Sink OS, which revolutionised browser-based computing and opened the door to new possibilities.

In an ever-changing environment like tech, Sink OS simply couldn't just stay the same; companies such as Microsoft and Apple are investing heavily in AI, which would theoretically increase the user's productivity. However, as this trend continues, companies are starting to lose their identity to AI; such a focus on AI is sending RAM and GPU prices through the roof.

The only way forward for Sink OS is to introduce AI, but we can't let it lose its own identity towards it; it needs a fresher UI, new features, built upon the already strong platform laid out by Sink OS V1 and most importantly, **remain one of the most secure browser-based operating systems on the planet.**

Welcome to the future of browser-based computing
Welcome to the future of Sink OS
Ladies and Gentlemen, Welcome To

Sink OS V2 sound plays

Sink OS, **V2**

Accounts + cross-platform working

In this update, Sink OS allows the creation of Accounts, enabling users to log in to their own accounts regardless of device. For example, I was writing a comparative thesis between the General Electric GE-90 and the GE-9X turbofan engines on my phone. With Sink OS V2, I can then save that thesis onto my account, and when I log onto my phone, Voila, the same thesis, word for word, on my account. What browser OS lets you do this?

Security

We've talked about accounts, but having accounts on **ANY** platform is useless if there's not a strong security system behind it. That's why when you log in, Sink OS uses TypeScript instead of JavaScript to prevent JavaScript hijacking. Pretend your browser is your house, you wouldn't

let that one freaky man living across your street from last year to read your mail, but what you would do is let a pizza delivery guy walk in and deliver the Pizza. Now imagine a website puts all your private data in that pizza box, another website orders pizza from that site, the same pizza delivery guy walks up to your house with the pizza (since that's allowed), and once you accept that pizza box, the website watches what's inside that box.

BOOM

Congratulations,
Your data is stolen :D

What TypeScript does is ensure that the data is sent in a way that **CAN'T** be in a way where data can be stolen, it's a massive leap in the right direction, to ensure Sink OS remains secure.

AI

This year, Sink OS introduces AI. There are many ways we could have sourced the AI. We could've gone to Microsoft and gotten the API and code for Copilot, or we could've gone and done the same with OpenAI and ChatGPT.

But Sink OS was heavily popularised by YOU GUYS
Not Microsoft
Not OpenAI
Not that one freaky man living across your house from earlier
YOU GUYS.

So we kept things local. Instead of getting another company to hand us the code to use their own AI, we built our own. By using parts from Google Gemini, we can transform it, and make an AI that's built for Sink OS, and an AI that puts **YOU** in the centre, it's **Human Centred AI**.

The AI goes by the name of Nexus.

It will give you detailed explanations for when you need it most

It will help you if you don't understand stuff.

And there's something I really wanna show.

With Nexus, you can have full conversations with it.

Not just by text, but by speech too, let me show it to you guys.

Get onto Nexus

Hi Nexus

Nexus: Hi, Rav (or something similar)

Introduce yourself to the crowd here

*Nexus: *introduces itself**

This is AI incorporation at its finest, and continues to highlight the possibilities within Sink OS.

Spotify

This year, we're proud to announce that Spotify can now be accessed through Sink OS, this allows users to listen to their favourite songs **right from Sink OS**, because who else is in their prime and not even in their final form.

Have a KSI Photo meme in the background.

Refreshed UI and faster boot-up times.

Ok, so I'll need you to put your hand up if you have a stopwatch or something they can use to time something.

Pick someone from the crowd.

Ok, so what I'll get you to do is that I'll get you to time how long both these sounds take, alright?

Most likely to agree.

Are you ready

Participant states if they are ready; if so, go to the next slide.

Alright, so I'll need you to start the timer.**NOW**.

Participant starts the timer.

Sink OS V1 boot-up sequence takes place.

Alright, so how long did that take?

Participant is to state how long the sequence took, which should be somewhere around 7.98 - 10 seconds.

Alright, so that took [enter start up sequence time], now I'll need you to time this, you ready?

Participant states if they're ready; if so, go to the next slide.

Start.. **NOW**

Sink OS V2 Bootup sequence takes place.

Alright, so how long did that take?

Participant states how long the sequence took, which should be somewhere around 4.5 - 5.6 seconds.

See, Sink OS V2 is [enter how many times faster it is] faster on bootup than it is when compared to last year's version, whilst **STILL** using only the same amount of resources, and it doesn't stop there,

Show Sink OS V2 UI

Sink OS V2 incorporates a new, fresh UI; it retains the familiarity of V1, but this time, it makes things more transparent, which gives Sink OS that fresh, new, and shiny look.

Future

Sink OS continues to progress day by day, month by month, year by year, but if we truly want to consolidate and really prove a threat against Puter and ChromeOS, Sink OS will be divided into 5 different "tiers", those being:

Sink OS Home V3

Sink OS Pro V3

Sink OS Ultra V3

And at the top of the chain

Sink OS **VMAX V3**.

Each is built for different use cases, and allows users to use whatever suits them best, because nothing within Sink OS should be “fixed.”. Sink OS is built around flexibility, not rigidity

Finishing off

And that concludes today’s presentation, thank you to all who came, its an honour to come up here today and introduce you all to Sink OS V2, I’d like to thank Mr Mejia for his continued support and just for being there for when I got stuck with stuff, he’s just been an incredible mentor for me and I couldn’t have been more happier to find out that he would be my mentor again for this year.

And so with that, take care.

Good evening

Good Night
